ClrMD workshop – Lab 2 | Counting duplicate strings

The goal of this workshop is to count duplicate strings

1. Use the same dump as Lab 1 and your previous application code or the available startup project to bootstrap the C# project

2. Write the code to list all objects and in case of an instance of a string type, count the number of duplicated strings

    1. Use a dictionary of <string, int> to count the string values

    2. Order the result by size of duplicated strings (i.e. 2 x length x count)
